The present study was conducted to collect, identify and document the flora of Nahargarh Wildlife Sanctuary, Jaipur district of Rajasthan, India. The Survey of plants of Sanctuary was carried out during 2022 to 2024. The different species collected during the surveys were identified with the help of various flora of Rajasthan taxonomic literature, taxonomy expert and Department of Botany, University of Rajasthan, Jaipur. A total of 506 plants species belonging to 90 families have been found in the investigation. Poaceae was the dominant family, followed by Fabaceae and Asteraceae.

**Keywords:** Biodiversity, Conservation, Distribution, Flora, Dicot, Poaceae, Species.

### Introduction

Biodiversity refers to the variety of life forms in various ecosystems, encompassing the different species of plants, animals, and microorganisms, the genetic differences within these species, and the ecosystems they form. Biodiversity has attracted world attention because of the growing awareness of its importance on the one hand and the anticipated massive depletion on the other<sup>1</sup>. Biological diversity must be regarded as a vital global resource that should be cataloged, utilized responsibly, and most importantly, preserved<sup>2</sup>. Beyond its significant economic, ethical, and aesthetic benefits, biodiversity is essential for sustaining ecosystem function and stability<sup>3,4,5</sup>. So, conservation of ecosystem and maintenance of biodiversity is matter of both national and international concern. Proper management of biodiversity worldwide ensures the wellbeing of populations. Ecosystems provide numerous services, including provisioning, regulating, and socio-cultural benefits<sup>6</sup>.

Floristic studies are essential for assessing Phytodiversity, which refers to the variety of plant life in a region. These

studies play a critical role in conservation management and the sustainable use of biological resources. They offer valuable insights into changing floristic patterns, the emergence of new invasive species, the current status of plant species, and the identification of rare, endemic, and threatened (RET) taxa in specific phytogeographical areas<sup>7</sup>.

The plant checklist provides a baseline that is crucial reference material for future ecological studies and a guide to rehabilitation of degraded sites within the forest. It will arouse interest to managers, researchers and partners of the need to conserve the forest. Further, the species checklist will enhance management and conservation of the forest especially for the threatened plants species of socio-economic and ecological importance.

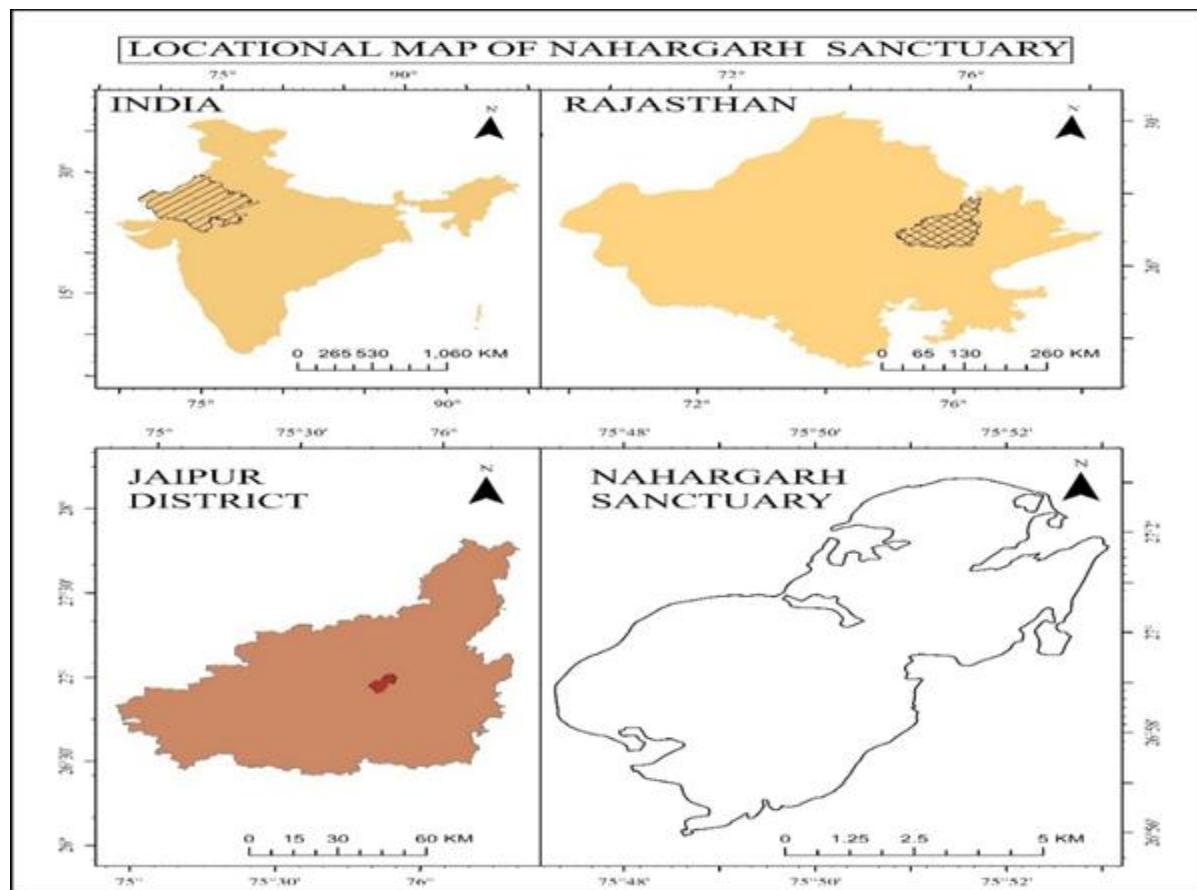

### Material and Methods

#### Study Area:

Rajasthan state covers 342,239 km<sup>2</sup> area of country. It has 25 wildlife sanctuaries which cover 5379.26 km<sup>2</sup> area of the state. The entire geographical area of the Jaipur district is 11,143 km<sup>2</sup>, with the total forest area of Jaipur is 554.86 km<sup>2</sup> which is

4.98% of the total area of the district<sup>8</sup>. Nahargarh wildlife sanctuary lies in the Jaipur district. It is in the outskirts of Jaipur city near Jaipur Delhi highway. The Nahargarh Wildlife Sanctuary is located in

the Aravalli ranges at Amber hills of Jaipur. The region covers 50 km<sup>2</sup> and is located between 26°56'15.08" to 26°57'5.81" N and 75°48'55.70" to 75°46'54.65" E (Figure 1).

**Figure 1. Key map of the study area in Jaipur, Rajasthan.**

The Sanctuary was notified vide Government of Rajasthan notification no. F11(39) Revenue/8/80 of dated 22 September 1980. Nahargarh Wildlife Sanctuary was named after the Nahargarh fort. The climate of the area is semi-arid characterized by distinct winter, summer and monsoon season. The forest found in this protected area is classified into Tropical Dry Deciduous and Tropical Thorne Forest as per classification of Champion and Seth<sup>9</sup>.

The extremely dry climate of Nahargarh is somewhat unfavorable to the luxuriant growth of plants because of scarcity of the water, however it supports very unique flora. Because of dominance of species of *Acacia* Mill. and scrubby nature of forest, it was neglected by explorers and hence remain unexplored for many years. That is why comprehensive and reliable floristic survey of Nahargarh is not available.

**Table 1. Flowering plants of Nahargarh Wildlife Sanctuary.**

Group	Families	Genera	Species
Dicots	78	272	403
Monocots	12	64	103
Total	90	336	506

Urbanized area in Jaipur region continue to expand and threatened protected areas. It is necessary to conserve and protect vegetation of these areas. Urban development produces some of the greatest local extinction rates and frequently eliminates the large majority of wild vegetation. Urbanization leads to habitat fragmentation, where larger continuous habitats are divided into smaller unconnected patches. The objective of this study is identification and documentation of flora (flowering plant species) of the Sanctuary.

#### *Field survey:*

Frequent Survey and exploration were undertaken covering the growth during rainy, winter & summer season in 2022 to 2024. Preliminary survey was undertaken throughout the sanctuary to identify the areas rich in diversity. The plant samples were collected on morphological and reproductive characters bases. These specimens were identified and confirmed with help of regional floras of Rajasthan ("Flora of North-East Rajasthan" by Sharma and Tiagi<sup>10</sup>, "Flora of Rajasthan" by Shetty and Singh<sup>11,12,13</sup>, "Flora of Rajasthan (South and South-East Rajasthan)" by Tiagi and Arey<sup>14</sup>, "Flora of South-Central Rajasthan" by Yadav and Meena<sup>15</sup>, and "Flora of Rajasthan" by Kotiya<sup>16</sup> and related literature.

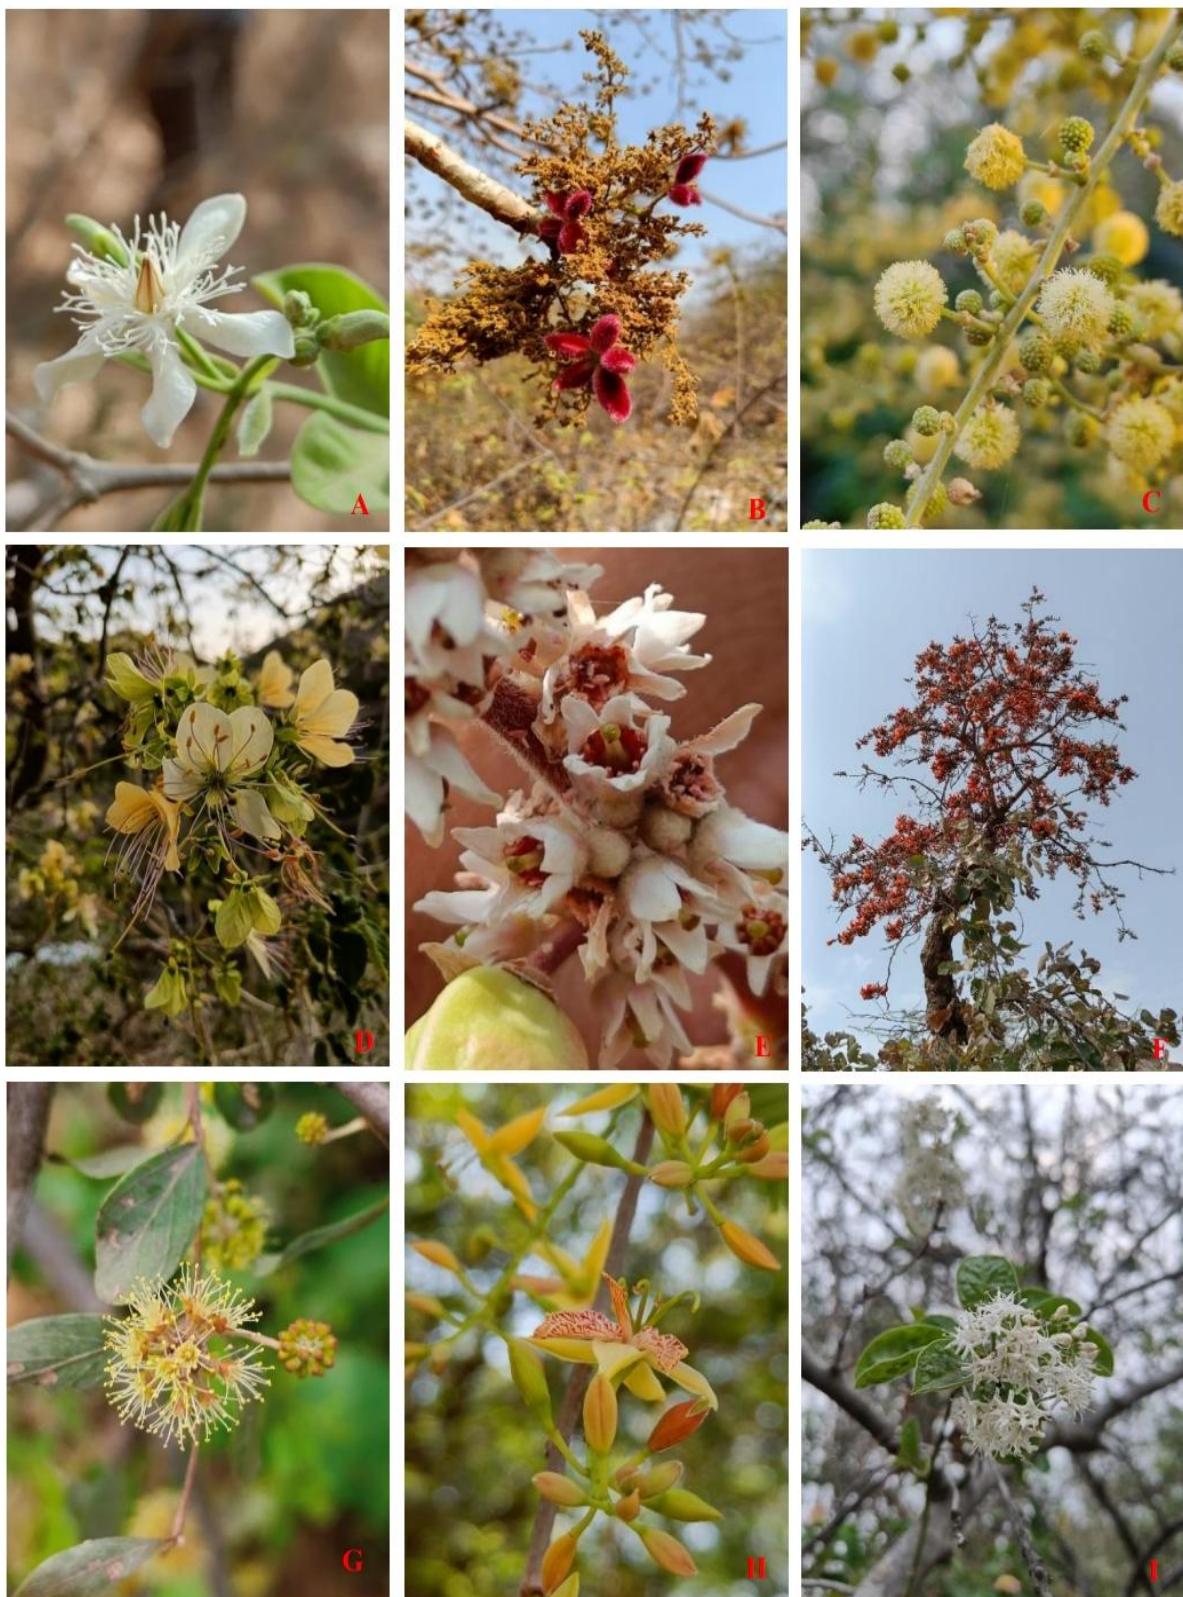

#### **Results and Discussion**

The present checklist is an attempt to list down all the angiospermic plant species currently found in the Nahargarh Wildlife Sanctuary, thereby enhancing our understanding of this unique ecosystem. This study identified a total of 506 species belonging to 336 genera and 90 families, classified according to the Bentham and Hooker system (Table 2.). Among these, dicots are represented by 403 species belonging to 272 genera and 78 families while Monocots are represented by 103 species belonging to 64 genera and 12

families (Table 1.). An analysis of the life-form composition reveals that herbaceous plants are the most prevalent, with 294 species, followed by 92 tree species, 71 shrub species, and 49 climbing species (Figure 7). This indicates a significant dominance of herbaceous plants within the sanctuary. *Anogeissus pendula*, *Acacia senegal*, *Boswellia serrata*, *Lannea coromandelica*, *Butea monosperma*, *Holoptelea integrifolia* etc., are some of the dominant tree species in the sanctuary. The families with high species diversity are Poaceae (65 species), Fabaceae (62), Asteraceae (34), Convolvulaceae (19), Acanthaceae (17), Euphorbiaceae (16), Cyperaceae (16), Malvaceae (14), Cucurbitaceae (13), Amaranthaceae (13) (Figure 8). The Nahargarh Wildlife Sanctuary features a tropical dry deciduous forest ecosystem, which supports a rich diversity of flora.

#### **Conclusion**

The comprehensive inventory of angiosperms provides a crucial baseline for future ecological monitoring and assessments, allowing researchers and conservationists to track changes in plant diversity over time. The sanctuary's plant composition faces significant threats from climate change, habitat loss, grazing, invasive species introduction, and anthropogenic disturbances, which may alter the current biodiversity in the near future. Increasing population of invasive species such as *Parthenium hysterophorus* L., *Lantana camara* L., and *Prosopis juliflora* DC. are significantly altering native vegetation by disrupting their natural habitat. In this study, the angiosperms of the sanctuary are classified according to the Bentham and Hooker system, identifying a total of 506 species distributed across 336 genera and 90 families. Among dicots, Fabaceae was found to be the largest family, while Poaceae was the largest family among monocotyledons. While doing field study in the sanctuary, we observed the

*Anogeissus sericea* plant species, which is threatened and endemic to Rajasthan. Previously, this plant species was found exclusively in seven districts: Sirohi (Mount Abu), Alwar, Udaipur, Sikar, Banswara, Rajsamand, and Jalore. This work focuses on the inventory of angiosperms to establish a comprehensive checklist of the sanctuary's floristic wealth, which will be essential for guiding sustainable resource utilization, conservation strategies, and the management of plant diversity.
